

Learn how to hack wifi password on android phone without app

Our Android usage depends heavily on Wi-Fi networks. The truth is that without Wi-Fi networks, the apps that have grown in popularity over time would be useless. However, these Wi-Fi networks can be hacked, and in this article we'll show you [how to hack wifi password on android phone without app](#). Thanks to the development of technology. But before doing anything, keep in mind that hacking is a major crime, and that using someone else's Wi-Fi password could have serious consequences.

Wireless Network Authentication

Most networks are password protected since they can be accessed by anybody with a wireless network-capable device. Let's examine some of the most popular authentication methods.

WEP

The term Wired Equivalent Privacy is known as WEP. For IEEE 802.11 WLAN standards, it was created. Its objective was to offer a similar level of privacy to wired networks. To prevent eavesdropping, WEP protects data being transmitted over networks by encrypting it.

WPA

Due to WEP's weaknesses, WPA was chosen as its replacement. Compared to its older version, it has more features, like the Temporal Key Integrity Protocol (TKIP). This feature used a dynamic 128-bit key, which was more difficult to crack than WEP's fixed, static key.

Knowing about the security is important to find out **how to hack wifi password on android phone without app**.

WPA2

The WPA2 standard, which replaces WPA, adds new features to the mix. The Counter Mode Cipher Block Chaining Message Authentication Code Protocol (CCMP) was used in place of TKIP since it performed data encryption better.

WPA2 has great success and has been the leading protocol since 2004. The Wi-Fi Alliance mandated that any future products bearing the Wi-Fi trademark must support WPA2 on March 13, 2006.

WPA3

The newest kid on the block, WPA3, is present in routers made in 2019. WPA3's new format improves encryption on open networks to discourage hackers from collecting data from them. A WPA3 router also has some additional features to defend against brute force attacks and is simpler to connect to with a device without a display. Keep reading to know about **how to hack wifi password on android phone without app**.

How to hack Wi-Fi password without root?

Wi-Fi can be hacked by using various methods. A different approach of **how to hack wifi password on android phone without app** would be to attempt to hack WiFi without root. But only WPS-enabled routers have this option. Follow these steps to learn how to perform it:

- Put the WPSPIN app in place on your device.
- Open the app on your gadget.
- The WPS enabled wireless Wi-Fi networks are immediately scanned by this software.
- Wait for the app to perform that.
- Choose the Wi-Fi network of your choice from all the available options.
- You now need to write the network's eight-digit pin.
- Now, unlock your device.
- Enter the eight-digit pin that you recorded when prompted.
- You can now access the Wi-Fi network.

How to hack Wi-Fi password on Android Smartphone without app?

Although Wi-advantages Fi's and applications are undeniable, there is also a security risk associated with it. There are numerous techniques to hack Wi-Fi. Unfortunately, this cannot be done without using an app, therefore it is impossible to hack any Wi-Fi password without one. However, you can use a variety of apps to complete your task.

End Note

The method makes it simple to crack any Wi-Fi-enabled WPS password with your mobile device, however regarding **how to hack wifi password on android phone without app**, it is impossible to crack a WiFi password on an Android phone without an app.
